

CU41, CU42 – MAINTAIN CONFIGURATION PROFILE

WHAT WE WILL LEARN

We will learn about maintaining the Configuration Profile

THESE ARE THE KEY POINTS

- Links the 300 Class Type to the Configurable Material.
- Can have object dependencies assigned to it.
- Different types of Bom Explosion
- Settings for Interface Design
- Settings for determining Stockable Variants

HERE IS THE DETAIL

Transaction:

CU41, CU42 – Maintain Configuration Profile

The Configuration Profiles allows us to link the type 300 class (or classes) to the configurable material.

But more importantly it controls how our configurable material interacts.

SAP Training
3sheep.com.au

There are three types of Interaction

Planned / Production Order
Sales Order
Order BOM

These depend on whether you want to have a sales BOM so you are picking components from stock, or you plan to produce using production orders.

BOM explosion can be

None
Single Level
Multi Level

There are many ways the BOM explosion can occur and will depend on your need. For example it is possible that you do not make the configurable material. It becomes the means to generate a sales bom. Then some of the components in the sales bom may themselves be configurable, or perhaps generate production requirements.

You can have component availability activated.

In the demo you will see an Interface Tab. This tab does not allow you build the interace here, but to define the name of it, and control other interactions.

These relate to display, variant matching (determines a stockable variant), pricing, whether the configurator starts automatically etc.

In a later lesson we will create an interface. This lets you group characteristics onto tabs. For example a tab could be ordering the colour and size of the box. Another tab could contain characteristics for the type of lid.
